PING(8) System Manager's Manual: iputils PING(8)
NAME
ping, ping6 - send ICMP ECHO_REQUEST to network hosts
SYNOPSIS
ping [-aAbBdDfhLnOqrRUvV] [-c count] [-F flowlabel] [-i interval] [-I interface]
[-l preload] [-m mark] [-M pmtudisc_option] [-N nodesinfo_option] [-w deadline]
[-W timeout] [-p pattern] [-Q tos] [-s packetsize] [-S sndbuf] [-t ttl] [-T
timestamp_option] [hop ...] destination
DESCRIPTION
ping uses the ICMP protocol's mandatory ECHO_REQUEST datagram to elicit an ICMP
ECHO_RESPONSE from a host or gateway. ECHO_REQUEST datagrams ('pings') have
an IP and ICMP header, followed by a struct timeval and then an arbitrary number
of 'pad' bytes used to fill out the packet.
ping6 is IPv6 version of ping, and can also send Node Information Queries
(RFC4620). Intermediate hops may not be allowed, because IPv6 source routing
was deprecated (RFC5895).
OPTIONS
-a Audible ping.
-A Adaptive ping. Interpacket interval adapts to round-trip time, so that
effectively not more than one (or more, if preload is set) unanswered
probe is present in the network. Minimal interval is 200msec for not
super-user. On networks with low rtt this mode is essentially equivalent
to flood mode.
-b Allow pinging a broadcast address.
-B Do not allow ping to change source address of probes. The address is
bound to one selected when ping starts.
-c count
Stop after sending count ECHO_REQUEST packets. With deadline option, ping
waits for count ECHO_REPLY packets, until the timeout expires.
-d Set the SO_DEBUG option on the socket being used. Essentially, this
socket option is not used by Linux kernel.
-D Print timestamp (unix time + microseconds as in gettimeofday) before each
line.
-f Flood ping. For every ECHO_REQUEST sent a period '.' is printed, while
for ever ECHO_REPLY received a backspace is printed. This provides a
2:%%- *Man ping* {PING(8) page 1 of 1} Top L1 (Man) [100.0%]
```

```
nemethf@hsn: ~
nemethf@hsn:~$ ping www.bme.hu
PING inspiro.eik.bme.hu (152.66.115.203) 56(84) bytes of data:
64 bytes from inspiro.eik.bme.hu (152.66.115.203): icmp_seq=1 ttl=60 time=0.535 ms

^C
--- inspiro.eik.bme.hu ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 2999ms
rtt min/avg/max/mdev = 0.426/0.531/0.583/0.065 ms
nemethf@hsn:~$
```

- ICMP echo request csomagokat küld a hálózatba
- körülfordulási idő mérésére, kapcsolat tesztelésére használják
- Google helyett a program használatát a 'man page'-ben érdemes megnézni

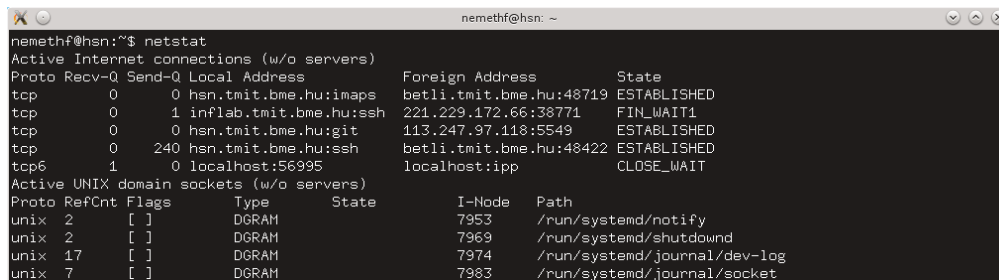

# Traceroute – csomagútvonal felderítése

- ▶ Egyre nagyobb Time-To-Live értékkel küld IP csomagokat a célcímre.
- ▶ A routerek csomagtovábbításakor csökkentik a TTL értéket.
- ▶ Ha lejár a TTL, a router *általában* ICMP TIME\_EXCEEDED csomagot küld a feladónak.

```

# Wireshark – grafikus tcpdump

- ▶ Tshark: (konzolban futtatható) szöveges wireshark
- ▶ Szintén pcap formátumot használ
- ▶ Moduláris felépítésű
  - ▶ *dissector* írja le egy protokoll működését
  - ▶ Python, Lua nyelven is írható hozzá dissector

# Hálózat konfigurálása linux hoszton

# Hálózat beállítási lehetőségei

---

- ▶ Disztribúciónként kicsit eltérő automatizmusok léteznek
  - ▶ De a “network manager”-t kell kikapcsolni, ha át akarjuk venni az irányítást
  - ▶ /etc/network könyvtár tartalmazza a konfigur. fájlokat
- ▶ Félautomatikus megoldás: DHCP
  - ▶ Dynamic Host Configuration Protocol
  - ▶ # dhclient eth0
  - ▶ beállítható: IP address/netmask, default gateway, DNS, ...
- ▶ Manuális beállítás
  - ▶ Ifconfig, ip (iproute2 csomag), route, iptables, ...

# ifconfig

► Könnyen áttekinthető a használata, mégis az 'ip'-t preferáljuk

```
root@betli:~# /etc/init.d/network-manager stop
Stopping network-manager (via systemctl): network-manager.service.
root@betli:~# ifconfig eth1 down

# iptables: tűzfal és NAT beállítása

---

- ▶ (későbbi órán tárgyaljuk)

# MPLS

---

## ▶ Enable mpls support

- ▶ `sysctl -w net.mpls.conf.eth0.input=1`
- ▶ `sysctl -w net.mpls.conf.eth1.input=1`
- ▶ `sysctl -w net.mpls.platform_labels=1000`

## ▶ Routing 10.10.10.10/32 to 192.168.1.2 with label 100:

- ▶ `ip route add 10.10.10.10/32 encap mpls 100 via inet 192.168.1.2`

## ▶ Label swapping 100 for 200 and sent to 192.168.2.2:

- ▶ `ip -f mpls route add 100 as 200 via inet 192.168.2.2`

## ▶ Decapsulating label 300 and delivering locally:

- ▶ `ip -f mpls route add 300 dev lo`

## ▶ To show MPLS routes you can do:

- ▶ `ip -f mpls route show`

# Több IP cím egy interfészen

---

▶ # `ifconfig eth0:0 192.168.1.6 up`

# Egyéb hasznos eszközök

# netcat

---

## Xterm-1

▶ `$ nc -l 2389`

▶ `HI, server`

## Xterm-2

▶ `$ nc localhost 2389`

▶ `HI, server`

# telnet

---

- ▶ Távoli terminál elérése **titkosítatlan** adatforgalommal
- ▶ Használjuk helyette az SSH-t
- ▶ Debuggolásra, fejlesztésre azért nagyszerű:
- ▶ Portkiosztás /etc/services

```

# Bash szkriptek

# A főcél: AUTOMATIZÁLÁS!

---

- ▶ **Unix filozófia:**
  - ▶ “write programs that do one thing, but do it well”
  - ▶ Egyszerű eszközök összefűzhetők:
    - ▶ `grep nemethf /etc/passwd | cut -f 5 -d:`
- ▶ **Komplex parancssori megoldások újrahasznosíthatók:**
  - ▶ “. filename”: parancsértelmező a fájl tartalmát végrehajta mint utasítások sorozatát
  - ▶ “filename”: a fájlt végrehajta az első néhány bájtja alapján
    - ▶ `Id: “file filename”`
- ▶ **Shebang: szövegfájl elején megadja a parancsértelmezőt**
  - ▶ **PI:** `#!/bin/bash`

# Példa: /etc/init.d/motd

```
#!/bin/sh
