

Hálózatok építése és üzemeltetése

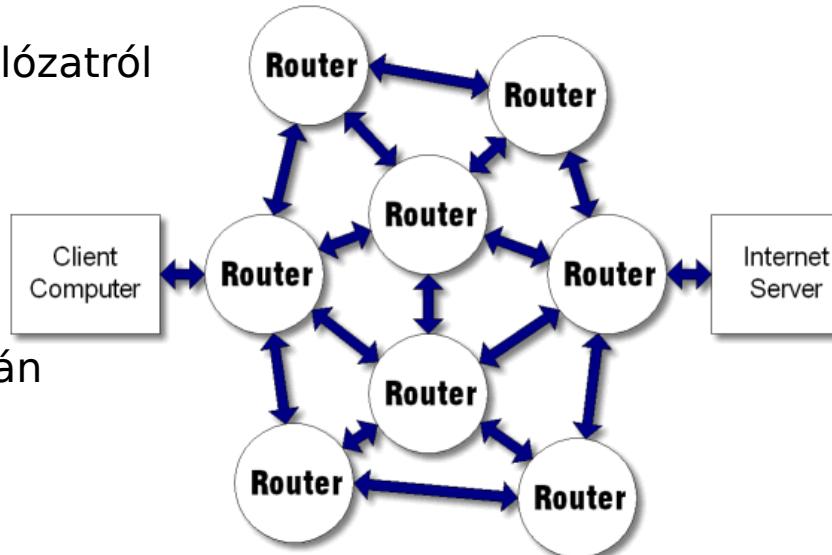

OSPF gyakorlat

Ismétlés

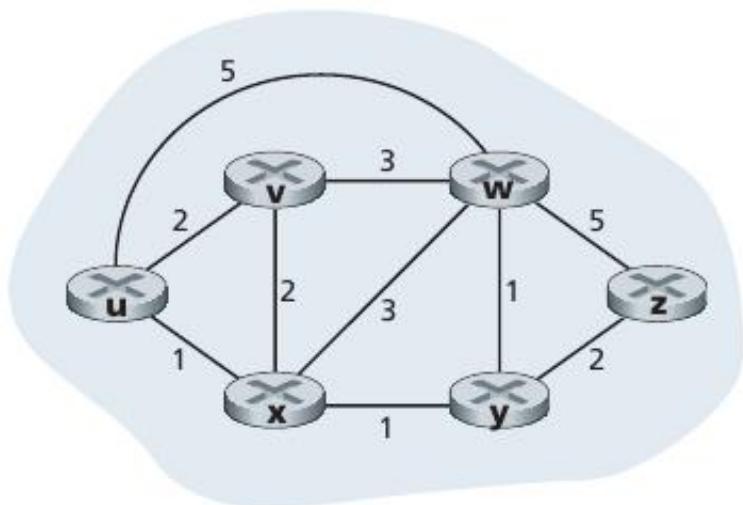

Routing protokollok

► Feladatuk

- ▶ optimális útvonal (next hop) kiszámítása bármely csomópontok között
 - ▶ aktuális állapot információ gyűjtés a hálózatról
 - ▶ útvonalak kalkulálása
- ▶ forwarding táblák
 - ▶ konfigurálása
 - ▶ dinamikus karbantartása, frissítése
 - ▶ bejövő routing protokoll üzenetek alapján
- ▶ routing információk
 - ▶ feldolgozása
 - ▶ terjesztése

Routing protokollok

- ▶ Hálózat: absztrakt gráf
 - ▶ csomópontok: routerek
 - ▶ élek: linkek
 - ▶ élköltség: valamelyen metrika (pl. késleltetés, sávszélesség kifejezése)
- ▶ cél:
 - ▶ (valamelyen értelemben) optimális, legkisebb költségű útvonal meghatározása két csomópont között
 - ▶ pl. legrövidebb út
- ▶ Ismerős algoritmusok:
 - ▶ Dijkstra algoritmus
 - ▶ Bellman-Ford algoritmus

J. Kurose, K. Ross, "Computer Networking: A Top-Down Approach", Pearson, 2012

Csoportosításuk

- ▶ Globális vs. Elosztott
 - ▶ globális: minden router ismeri a teljes topológiát
 - ▶ elosztott: minden router csak a szomszédjait és a tőlük kapott üzeneteket ismeri
- ▶ Intra-domain vs. Inter-domain
 - ▶ intra: Interior Gateway Protocol (IGP)
 - ▶ közös adminisztratív domain
 - ▶ rugalmatlan szabályok
 - ▶ egyes esetekben nem jól skálázódik
 - ▶ inter: Exterior Gateway Protocol (EGP)
 - ▶ külön adminisztratív domainek, AS-ek (Autonomous System) között
 - ▶ jól skálázódik (internet)
- ▶ Link state vs. Distance Vector (ld. később)

Csoportosításuk

- ▶ Interior Gateway Protocol (IGP) példák
 - ▶ OSPF (OpenShortest Path First)
 - ▶ IS-IS (Intermediate System to Intermediate System)
 - ▶ RIP (Routing Information Protocol)
 - ▶ EIGRP (Enhanced Interior Gateway Routing Protocol)
- ▶ Exterior Gateway Protocol (EGP)
 - ▶ BGP (Border Gateway Protocol)
 - ▶ Id. MSC (Internet architektúra és szolgáltatások főspecializáció)

Link State alapú routing

- ▶ Működési elv
 - ▶ globális nézeten dolgozik
 - ▶ LSP: Link State Packet (id, costs, seq.no, ttl)
 - ▶ egy router
 - ▶ mindenkinél küld LSP-t (broadcast)
 - ▶ a közvetlenül kapcsolódó linkjeiről
 - ▶ periodikusan újra generálja (seq.no++)
 - ▶ legfrissebb beérkezett LSP-ket tárolja
 - ▶ mindenki ugyanazt a topológiát látja
 - ▶ azon számolja az útvonalakat
 - ▶ útvonalszámítás: Dijkstra algoritmus

Például: OSPF

- ▶ Open Shortest Path First (v2)
- ▶ nyílt, IETF szabvány
 - ▶ v2: RFC 2328
 - ▶ IP felett
- ▶ együttműködés különböző gyártók termékei között!
- ▶ korlátozott erőforrás igény
- ▶ viszonylag gyors, automatikus konvergencia topológia változásokra
- ▶ támogatja
 - ▶ különböző útvonal költségek számítását
 - ▶ hierarchikus, többszintű topológiát
 - ▶ alkalmazás típusára alapozott forgalomirányítást
 - ▶ autentikációt minden üzenetre

Hálózatemulációs környezet

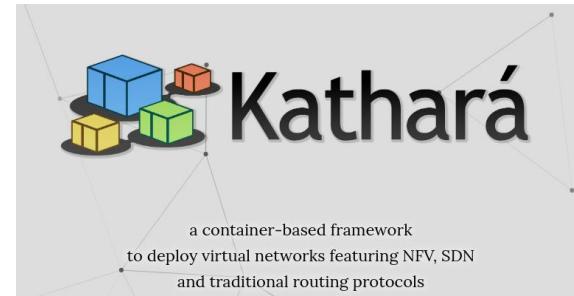

Netkit, Quagga

Netkit

The poor man's system for experimenting
computer networking

| | |
|--------------------|---|
| Version | 2.3 |
| Author(s) | G. Di Battista, M. Patrignani, M. Pizzonia, M. Rimondini |
| E-mail | contact@netkit.org |
| Web | http://www.netkit.org/ |
| Description | an introduction to the architecture, setup, and usage of Netkit |

Újabb platformjuk:

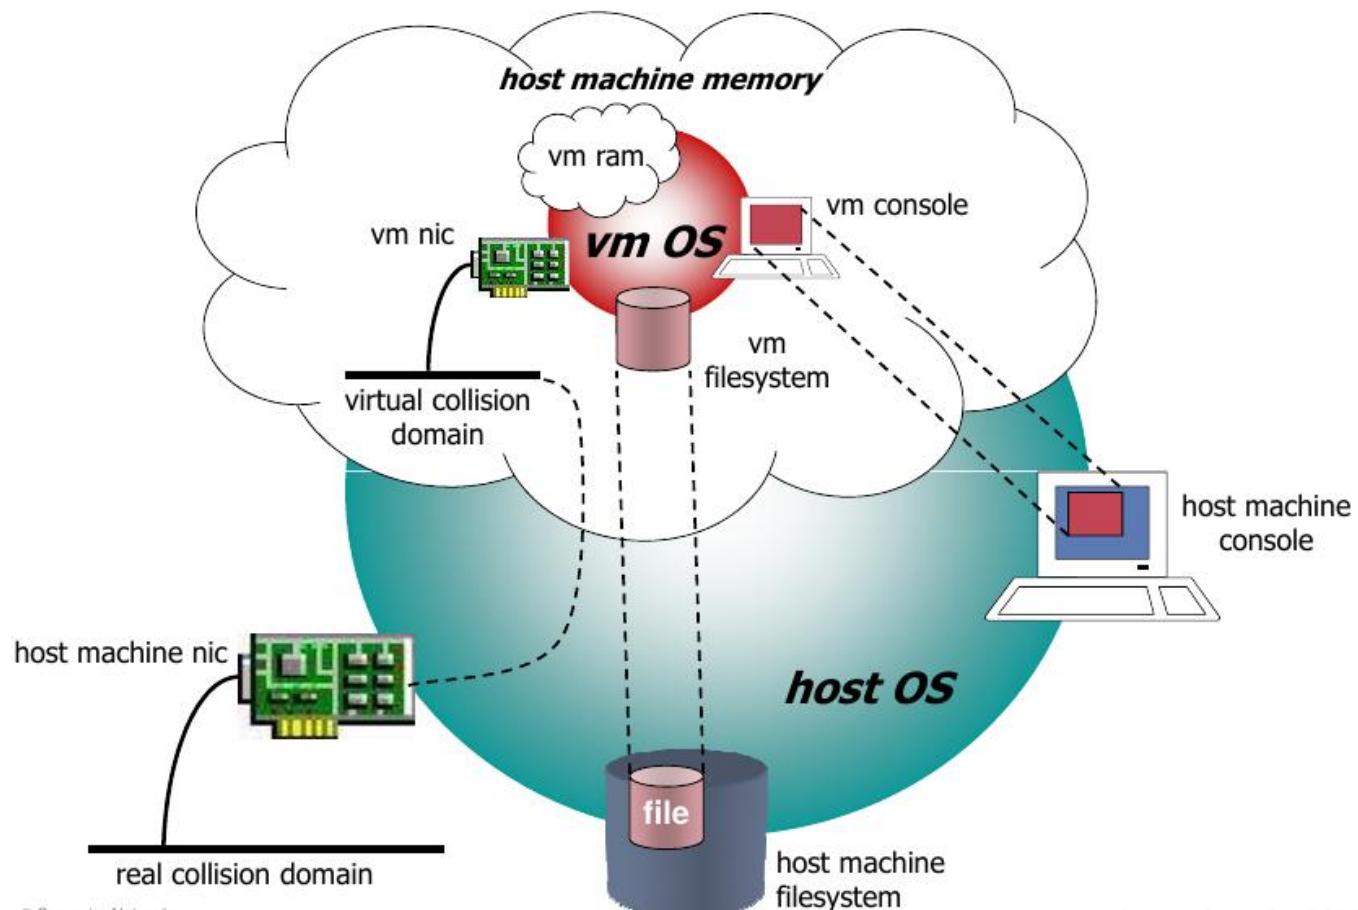

netkit: a system for emulating computer networks

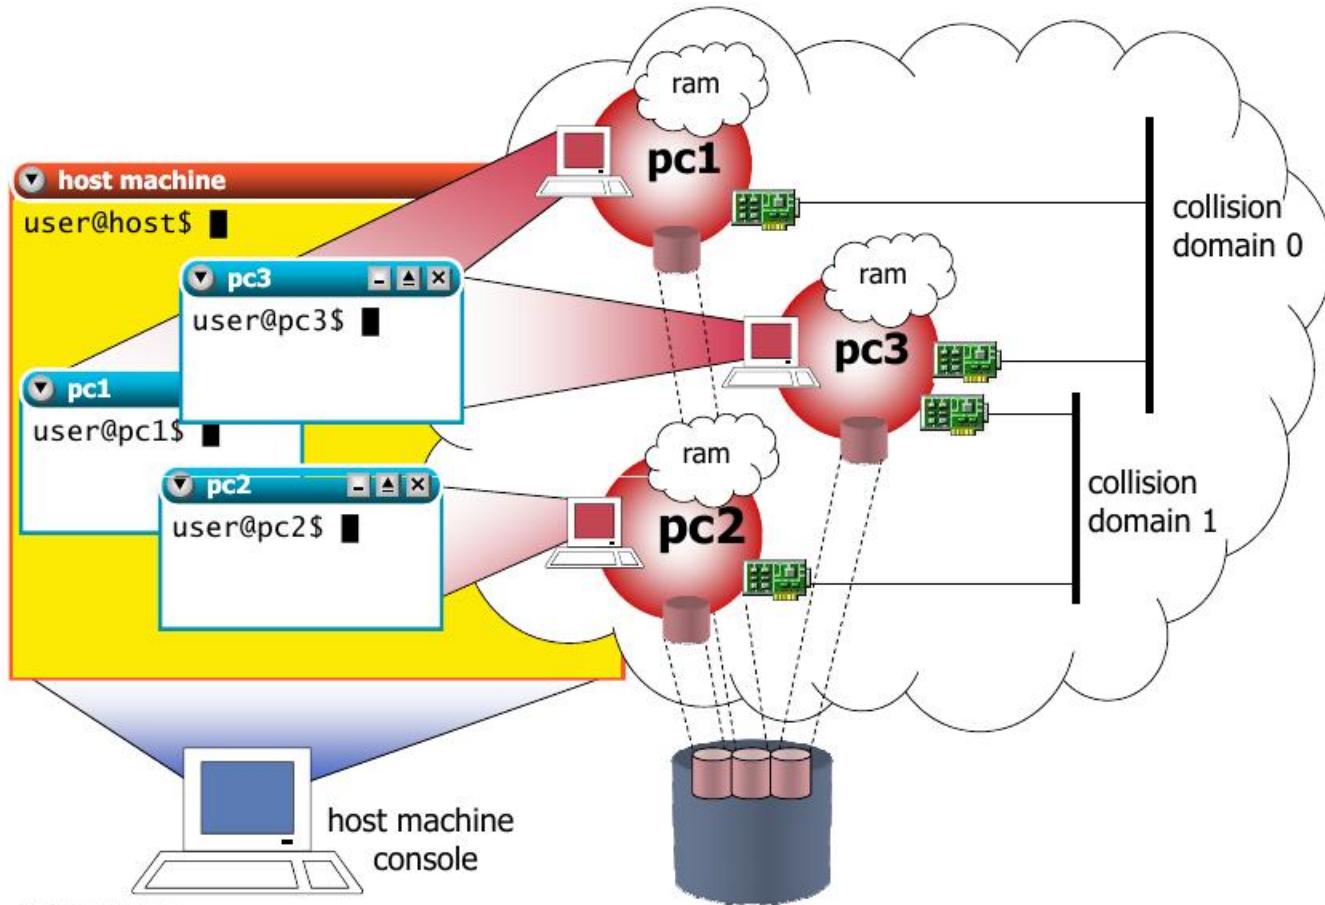

- based on uml (user-mode linux)
 - <http://user-mode-linux.sourceforge.net/>
- each emulated network device is a virtual linux box
 - a virtual linux box is one that is based on the uml kernel
- note: the linux os is shipped with software supporting most of the network protocols
 - hence, any linux machine can be configured to act as a bridge/switch or as a router

Netkit

Netkit

netkit vcommands

- allow to startup virtual machines with arbitrary configurations (memory, network interfaces, etc.)
 - **vstart**: starts a new virtual machine
 - **vlist**: lists currently running virtual machines
 - **vconfig**: attaches network interfaces to running vms
 - **vhalt**: gracefully halts a virtual machine
 - **vcrash**: causes a virtual machine to crash
 - **vclean**: “panic command” to clean up all netkit processes (including vms) and configuration settings on the host machine

netkit lcommands

- ease setting up complex labs consisting of several virtual machines
 - `lstart`: starts a netkit lab
 - `lhalt`: gracefully halts all vms of a lab
 - `lcrash`: causes all the vms of a lab to crash
 - `lclean`: removes temporary files from a lab directory
 - `linfo`: provides information about a lab without starting it
 - `ltest`: allows to run tests to check that the lab is working properly

Quagga/Zebra

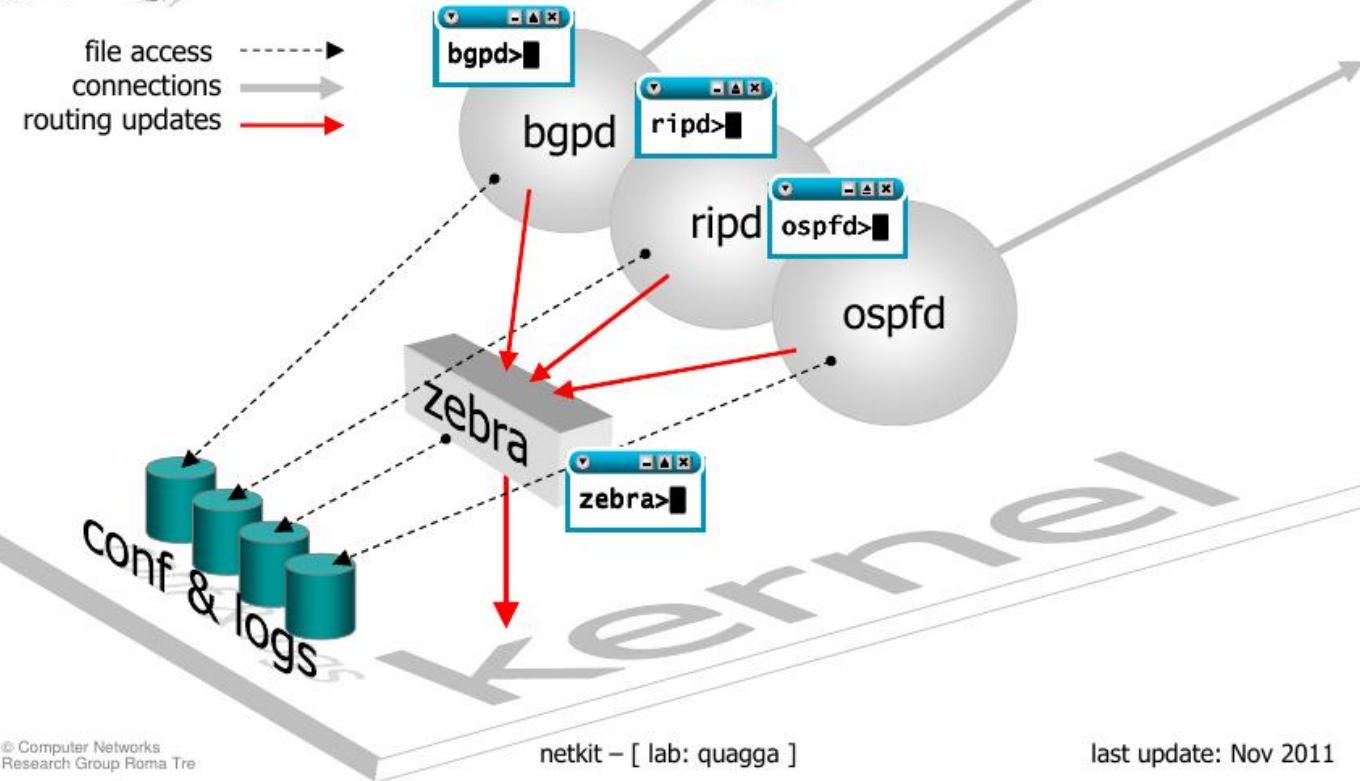

- ▶ Routing Szoftver csomag
 - ▶ GPL
 - ▶ FreeBSD, Linux, Solaris, NetBSD
 - ▶ GNU Zebra volt előbb
 - ▶ Quagga egy fork volt
 - ▶ “The Quagga tree aims to build a more involved community around Quagga than the current centralised model of GNU Zebra.”
 - ▶ az élővilágban a quagga halt ki
 - ▶ a routing világban a zebra

Quagga/Zebra

- ▶ Routing Szoftver csomag
 - ▶ zebra (core daemon)
 - ▶ kernel interface, static routes
 - ▶ zserv szerver (API) -> quagga kliensek felé
 - ▶ quagga démonok
 - ▶ routing protokollok
 - ripd, ripngd, ospfd, ospf6d, bgpd, isisd
 - ▶ mindegyikkel dedikált CLI-n (vty) keresztül kommunikálhatunk
 - hasonló interfész, mint egy HW routernél
 - ▶ speciális quagga tool: vtysh
 - közös front-end minden démonhoz

zebra: a routing daemon

Vizsgálati környezet kialakítása

- ▶ **QBF12: BME Cloud (Smallville), template: HaEpUz 2022 ...**
- ▶ ~~IB213 labor: default HaEpUz (Mininet + Netkit) boot image~~
- ▶ ~~Saját gép:~~
 - ▶ ~~Kiadott HaEpUz VM (Jupyter Notebook)~~
 - ▶ ~~de most nem a notebookot használjuk~~
 - ▶ ~~Indítás (importálás): Virtualbox vagy VMware player~~
- ▶ A rendszer egy Ubuntu 64-bit Linux + desktop environment, tartalma:
 - ▶ Mininet hálózatemuláció
 - ▶ Netkit hálózatemuláció
- ▶ OSPF lab indítása:
 - ▶ `$ cd ~/netkit/labs/netkit-lab_ospf-singlearea`
 - ▶ `$ lstart`

Dinamikus működés

- ▶ OSPF üzenetek (Hello, majd LSA-k)
- ▶ Mi történik, ha lemegey egy link?
- ▶ Mi történik, ha lemegey egy DR link?
- ▶ Mi történik, ha lemegey egy router?

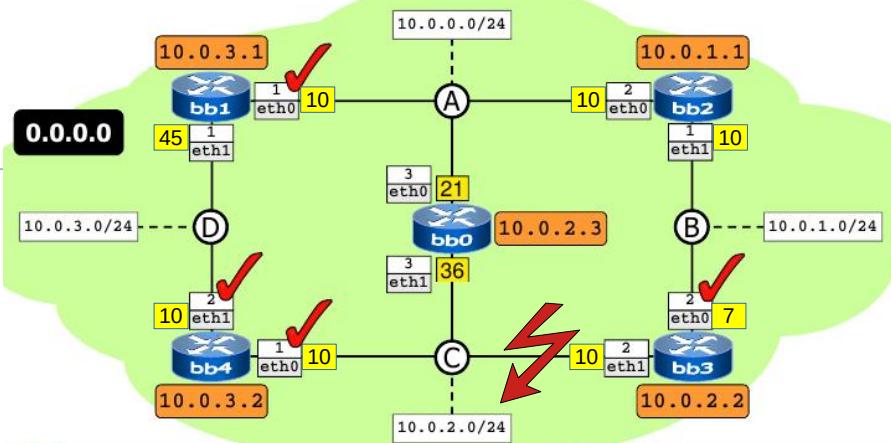

1. feladat: Router kommunikáció

- ▶ OSPF Hello üzenetek, később LSA-k
 - ▶ tcpdump -ne ip proto ospf
 - ▶ (esetleg -vv a részletes nézethez)
 - ▶ vizsgáljuk meg részletesebben
 - ▶ (később is érdemes pl. az egyik routeren futtatni)

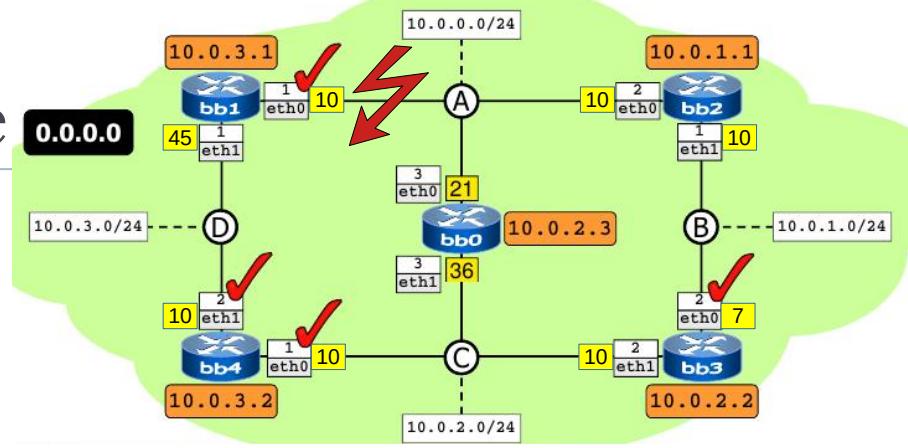

2. feladat: link kiesése

- ▶ Mi történik, ha lemegey egy link?
 - ▶ ifconfig vagy ip parancs használható
 - ▶ pl. BB3 eth1 interfész down
 - ▶ hogy változnak az útvonalak?
 - ▶ pl. BB1-ről → 10.0.2.1 felé
 - traceroute -I icmp 10.0.2.1
 - ▶ routing táblák vizsgálata
 - show ip ospf route
 - ▶ kapcsoljuk vissza az interfészt

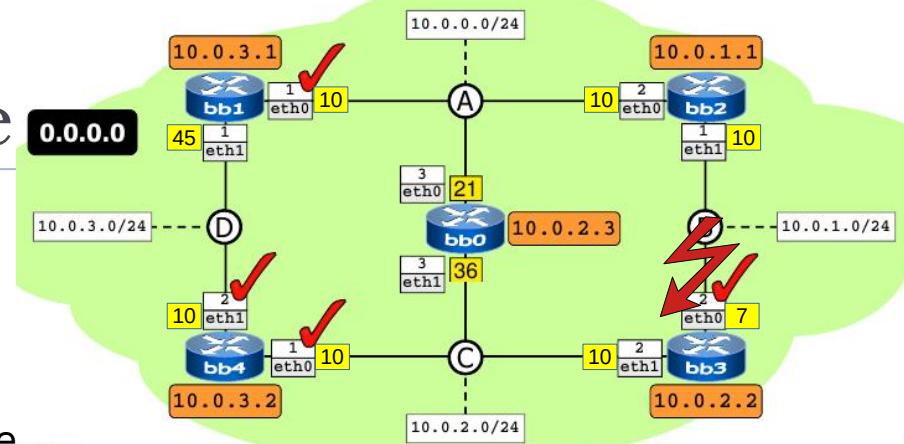

3a. feladat: DR link kiesése

- ▶ Mi történik, ha DR link megy le?
 - ▶ pl. BB1 eth0 down
 - ▶ BB4-en router kommunikáció figyelése
 - tcpdump -ne ip proto ospf
 - ▶ BB2-n ospfd logok figyelése
 - tail -f /var/log/quagga/ospfd.log
 - ▶ BB0-n OSPF database ellenőrzése
 - show ip ospf database
 - ▶ BB1-en útvonalak ellenőrzése
 - BB1 eléri a 10.0.0.0 hálózatot?
 - mi történt?
 - ▶ BB1-en húzzuk vissza az eth0 interfészt
 - ▶ minden vizsgáljunk újra

3b. feladat: DR link kiesése

- ▶ Mi történik, ha DR link megy le?
 - ▶ pl. BB3 eth0 down
 - ▶ BB2-n ospfd logok figyelése
 - tcpdump -ne ip proto ospf
 - ▶ BB0-n OSPF interfészek és database figyelése
 - show ip ospf interface
 - show ip ospf database
 - ▶ BB3 eléri a 10.0.1.0 hálózatot?
 - ▶ mi történt a 10.0.1.0 hálózathoz tartozó "Net Link"-kel?
 - ▶ BB3-n húzzuk vissza az eth0 interfészt
 - ▶ minden vizsgáljunk újra

4. feladat: router kiesése

- ▶ Mi történik, ha lemegey egy router?
 - ▶ pl. minden interfészét down állapotba kapcsoljuk
 - ▶ házi feladat
