

# Hálózatok építése és üzemeltetése

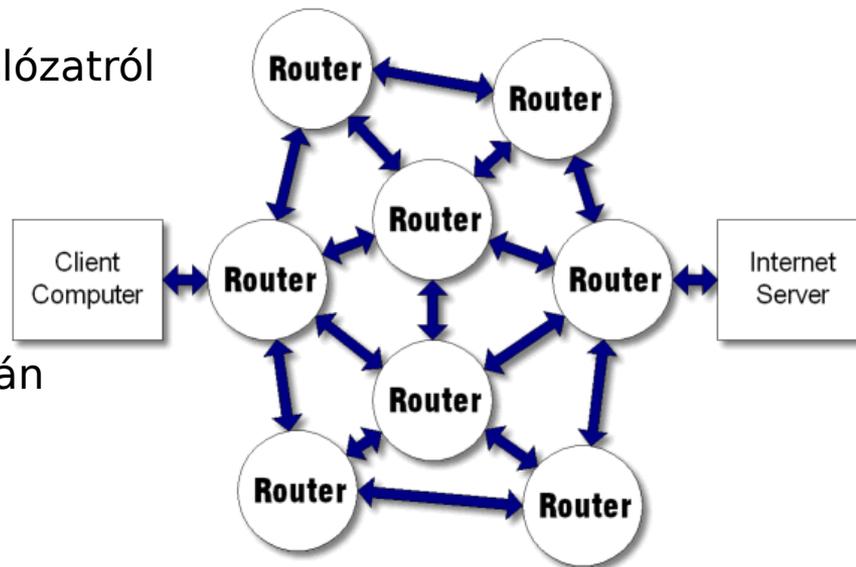

## OSPF gyakorlat

# Ismétlés

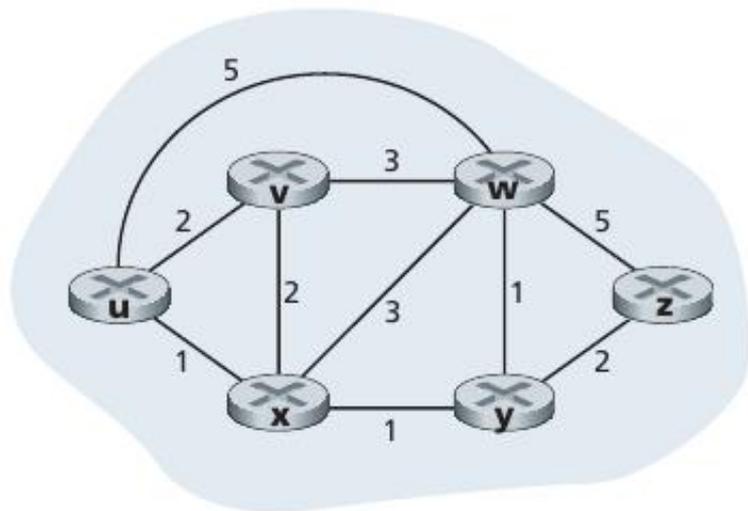

# Routing protokollok

## ▶ Feladatuk

- ▶ optimális útvonal (next hop) kiszámítása bármely csomópontok között
  - ▶ aktuális állapot információ gyűjtés a hálózatról
  - ▶ útvonalak kalkulálása
- ▶ forwarding táblák
  - ▶ konfigurálása
  - ▶ dinamikus karbantartása, frissítése
  - ▶ bejövő routing protokoll üzenetek alapján
- ▶ routing információk
  - ▶ feldolgozása
  - ▶ terjesztése

# Routing protokollok

- ▶ Hálózat: absztrakt gráf
  - ▶ csomópontok: routerek
  - ▶ élek: linkek
  - ▶ élköltség: valamilyen metrika (pl. késleltetés, sáv szélesség kifejezése)
- ▶ cél:
  - ▶ (valamilyen értelemben) optimális, legkisebb költségű útvonal meghatározása két csomópont között
    - ▶ pl. legrövidebb út
- ▶ Ismerős algoritmusok:
  - ▶ Dijkstra algoritmus
  - ▶ Bellman-Ford algoritmus

# Csoportosításuk

---

- ▶ **Globális vs. Elosztott**
  - ▶ globális: minden router ismeri a teljes topológiát
  - ▶ elosztott: minden router csak a szomszédjait és a tőlük kapott üzeneteket ismeri
- ▶ **Intra-domain vs. Inter-domain**
  - ▶ intra: Interior Gateway Protocol (IGP)
    - ▶ közös adminisztratív domain
    - ▶ rugalmatlan szabályok
    - ▶ egyes esetekben nem jól skálázódik
  - ▶ inter: Exterior Gateway Protocol (EGP)
    - ▶ külön adminisztratív domaineik, AS-ek (Autonomous System) között
    - ▶ jól skálázódik (internet)
- ▶ **Link state vs. Distance Vector (ld. később)**

# Csoportosításuk

---

- ▶ Interior Gateway Protocol (IGP) példák
  - ▶ OSPF (OpenShortest Path First)
  - ▶ IS-IS (Intermediate System to Intermediate System)
  - ▶ RIP (Routing Information Protocol)
  - ▶ EIGRP (Enhanced Interior Gateway Routing Protocol)
- ▶ Exterior Gateway Protocol (EGP)
  - ▶ BGP (Border Gateway Protocol)
  - ▶ Id. MSC (Internet architektúra és szolgáltatások főspecializáció)

# Link State alapú routing

---

- ▶ Működési elv
  - ▶ globális nézetten dolgozik
  - ▶ LSP: Link State Packet (id, costs, seq.no, ttl)
  - ▶ egy router
    - ▶ mindenkinek küld LSP-t (broadcast)
    - ▶ a közvetlenül kapcsolódó linkjeiről
    - ▶ periodikusan újra generálja (seq.no++)
    - ▶ legfrissebb beérkezett LSP-eket tárolja
  - ▶ mindenki ugyanazt a topológiát látja
  - ▶ azon számolja az útvonalakat
  - ▶ útvonalszámítás: Dijkstra algoritmus

# Például: OSPF

---

- ▶ Open Shortest Path First (v2)
- ▶ nyílt, IETF szabvány
  - ▶ v2: RFC 2328
  - ▶ IP felett
- ▶ együttműködés különböző gyártók termékei között!
- ▶ korlátozott erőforrás igény
- ▶ viszonylag gyors, automatikus konvergencia topológia változásokra
- ▶ támogatja
  - ▶ különböző útvonal költségek számítását
  - ▶ hierarchikus, többszintű topológiát
  - ▶ alkalmazás típusára alapozott forgalomirányítást
  - ▶ autentikációt minden üzenetre

# Hálózatemulációs környezet

Netkit, Quagga

# Netkit

The poor man's system for experimenting  
computer networking

<b>Version</b>	2.3
<b>Author(s)</b>	G. Di Battista, M. Patrignani, M. Pizzonia, M. Rimondini
<b>E-mail</b>	contact@netkit.org
<b>Web</b>	<a href="http://www.netkit.org/">http://www.netkit.org/</a>
<b>Description</b>	an introduction to the architecture, setup, and usage of Netkit

Újabb platformjuk:

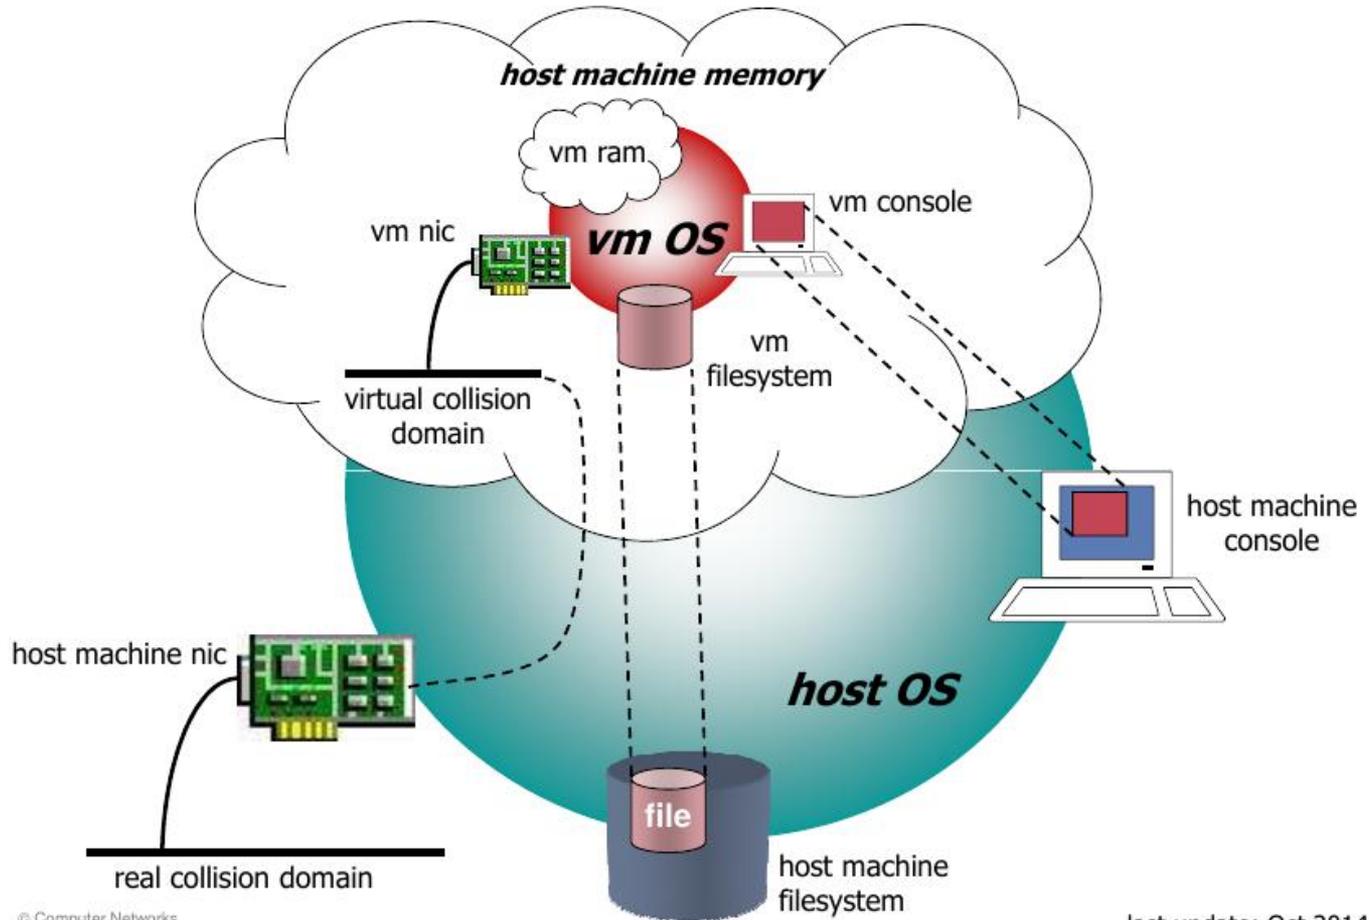

# Kathará

a container-based framework  
to deploy virtual networks featuring NFV, SDN  
and traditional routing protocols

# netkit: a system for emulating computer networks

- based on uml (user-mode linux)
  - <http://user-mode-linux.sourceforge.net/>
- each emulated network device is a virtual linux box
  - a virtual linux box is one that is based on the uml kernel
- note: the linux os is shipped with software supporting most of the network protocols
  - hence, any linux machine can be configured to act as a bridge/switch or as a router

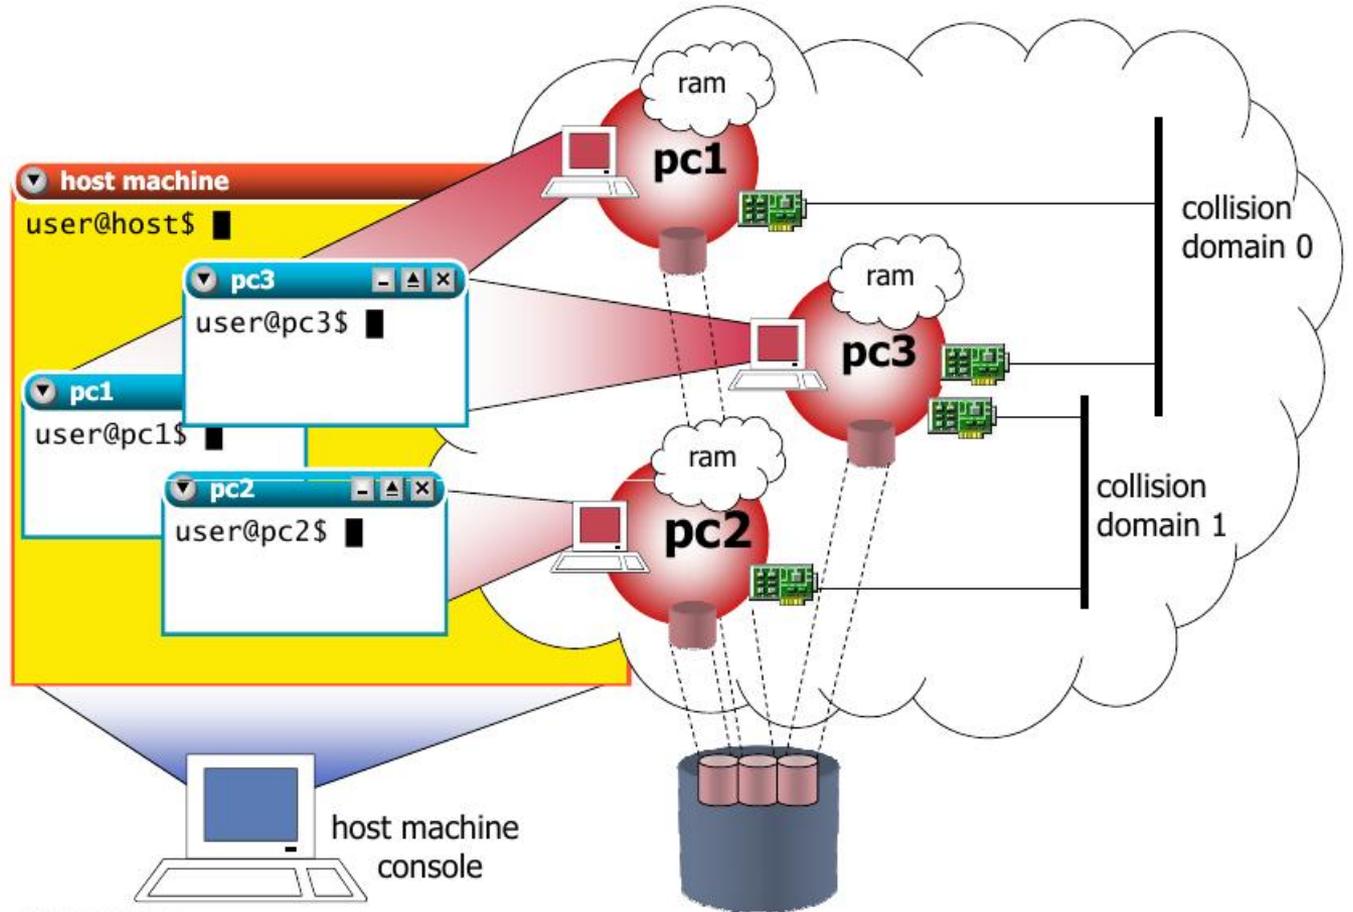

# Netkit

© Computer Networks

last update: Oct 2014

# Netkit

# netkit vcommands

- allow to startup virtual machines with arbitrary configurations (memory, network interfaces, etc.)
  - **vstart**: starts a new virtual machine
  - **vlist**: lists currently running virtual machines
  - **vconfig**: attaches network interfaces to running vms
  - **vhalt**: gracefully halts a virtual machine
  - **vcrash**: causes a virtual machine to crash
  - **vclean**: “panic command” to clean up all netkit processes (including vms) and configuration settings on the host machine

# netkit lcommands

- ease setting up complex labs consisting of several virtual machines
  - **lstart**: starts a netkit lab
  - **lhalt**: gracefully halts all vms of a lab
  - **lcrash**: causes all the vms of a lab to crash
  - **lclean**: removes temporary files from a lab directory
  - **linfo**: provides information about a lab without starting it
  - **ltest**: allows to run tests to check that the lab is working properly

# Quagga/Zebra

---

- ▶ Routing Szoftver csomag
  - ▶ GPL
  - ▶ FreeBSD, Linux, Solaris, NetBSD
  - ▶ GNU Zebra volt előbb
  - ▶ Quagga egy fork volt
    - ▶ “The Quagga tree aims to build a more involved community around Quagga than the current centralised model of GNU Zebra.”
    - ▶ az élővilágban a quagga halt ki
    - ▶ a routing világban a zebra

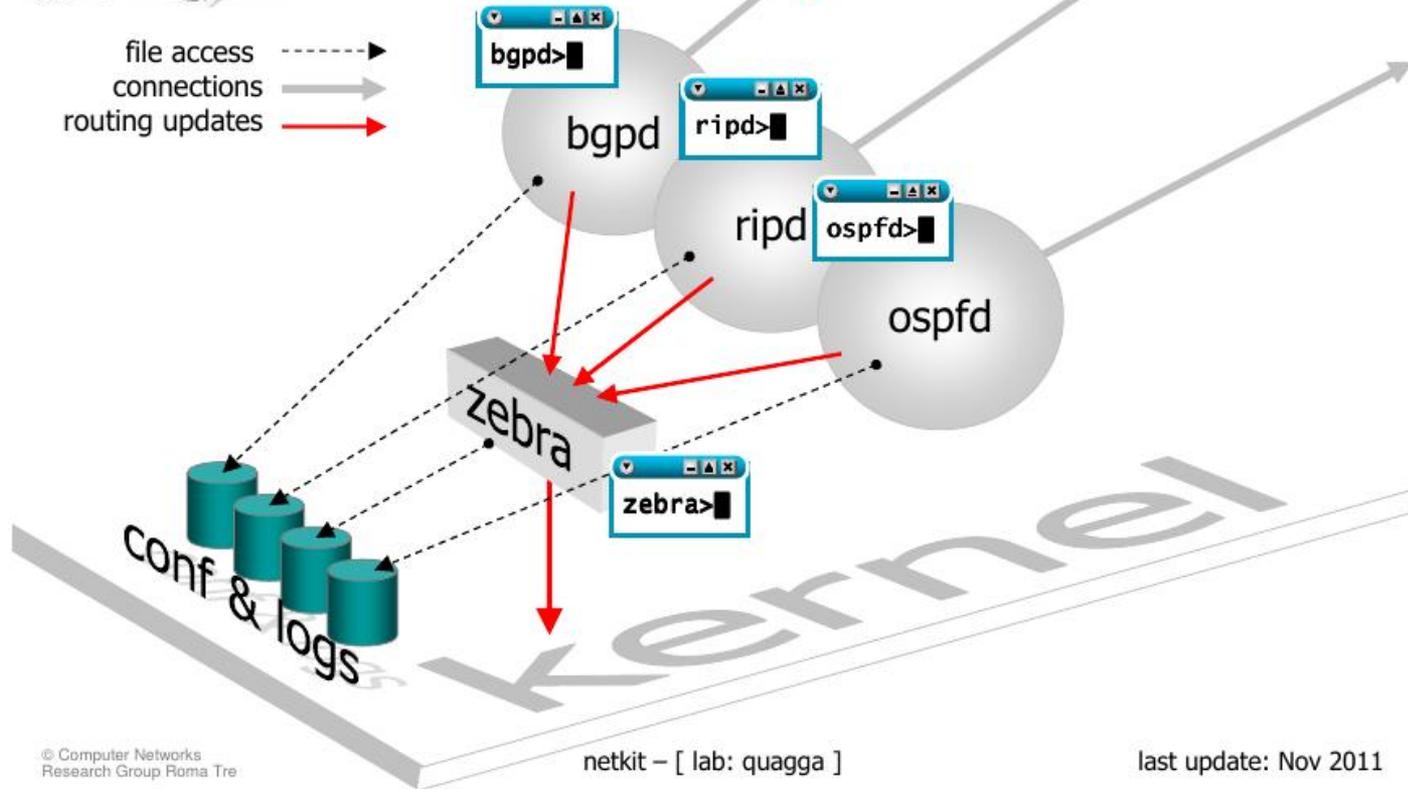

# Quagga/Zebra

---

- ▶ Routing Szoftver csomag
  - ▶ zebra (core daemon)
    - ▶ kernel interface, static routes
    - ▶ zserv szerver (API) -> quagga kliensek felé
  - ▶ quagga démonok
    - ▶ routing protokollok
      - ripd, ripngd, ospfd, ospf6d, bgpd, isisd
    - ▶ mindegyikkel dedikált CLI-n (vty) keresztül kommunikálhatunk
      - hasonló interfész, mint egy HW routernél
    - ▶ speciális quagga tool: vtysh
      - közös front-end minden démonhoz

# zebra: a routing daemon

# Dinamikus működés

---

- ▶ OSPF üzenetek (Hello, majd LSA-k)
- ▶ Mi történik, ha lemegy egy link?
- ▶ Mi történik, ha lemegy egy DR link?
- ▶ Mi történik, ha lemegy egy router?

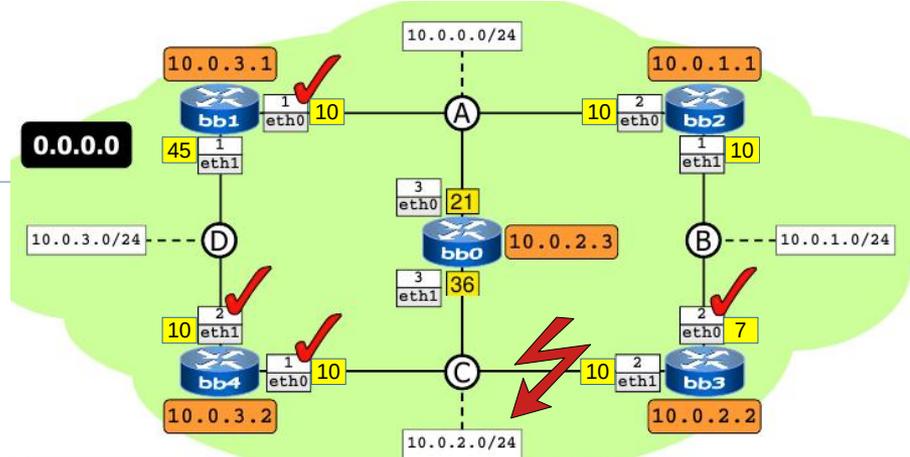

# 1. feladat: Router kommunikáció

---

- ▶ OSPF Hello üzenetek, később LSA-k
  - ▶ tcpdump -ne ip proto ospf
  - ▶ (esetleg -vv a részletes nézethez)
  - ▶ vizsgáljuk meg részletesebben
  - ▶ (később is érdemes pl. az egyik routeren futtatni)

## 2. feladat: link kiesése

- ▶ Mi történik, ha lemegy egy link?
  - ▶ ifconfig vagy ip parancs használható
  - ▶ pl. BB3 eth1 interfész down
  - ▶ hogy változnak az útvonalak?
    - ▶ pl. BB1-ről → 10.0.2.1 felé
      - traceroute -l icmp 10.0.2.1
      - routing táblák vizsgálata
        - show ip ospf route
  - ▶ kapcsoljuk vissza az interfészt

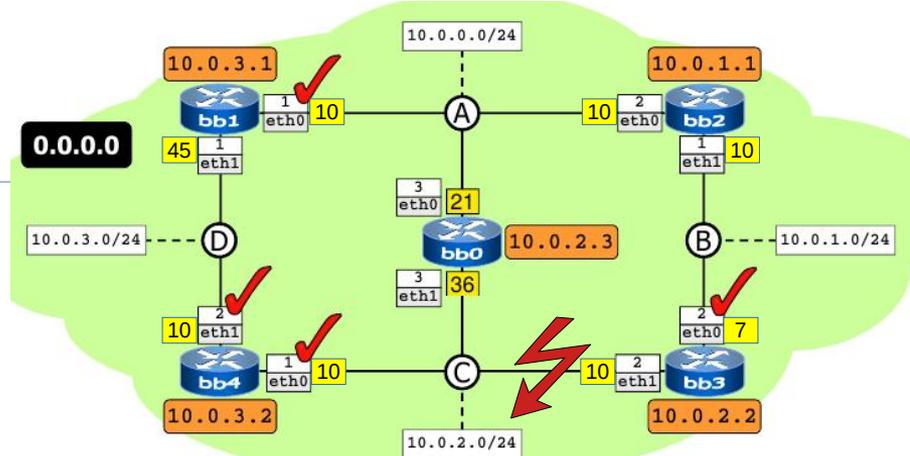

## 2. feladat: link kiesése

### ▶ Mi történik, ha lemegy egy link?

- ▶ ifconfig vagy ip parancs használható
- ▶ pl. BB3 eth1 interfész down
- ▶ hogy változnak az útvonalak?
  - ▶ pl. BB1-ről → 10.0.2.1 felé
    - traceroute -l icmp 10.0.2.1
  - ▶ routing táblák vizsgálata
    - show ip ospf route

### ▶ kapcsoljuk vissza az interfészt

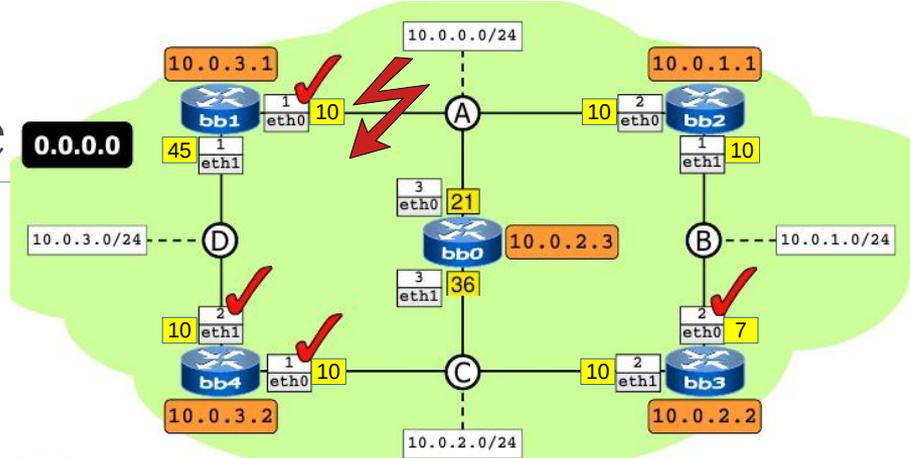

```
bb1:~# traceroute 10.0.2.1
traceroute to 10.0.2.1 (10.0.2.1), 64 hops max, 40 byte packets
 1 10.0.0.3 (10.0.0.3) 9 ms 1 ms 1 ms
 2 10.0.2.1 (10.0.2.1) 13 ms 2 ms 0 ms
```

```
bb1# sho ip route
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       I - ISIS, B - BGP, > - selected route, * - FIB route

O 10.0.0.0/24 [110/10] is directly connected, eth0, 00:20:30
C>* 10.0.0.0/24 is directly connected, eth0
O>* 10.0.1.0/24 [110/20] via 10.0.0.2, eth0, 00:19:37
