

Hálózatok építése és üzemeltetése

OSPF gyakorlat

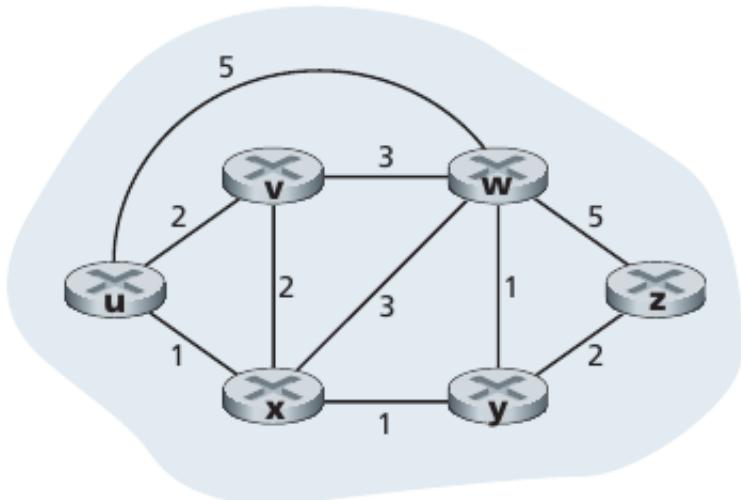

Ismétlés

Routing protokollok

▶ Feladatuk

- ▶ optimális útvonal biztosítása bármely csomópontok között
 - ▶ aktuális állapot információ a hálózatról
 - ▶ útvonalak kalkulálása
- ▶ forwarding táblák
 - ▶ konfigurálása
 - ▶ dinamikus karbantartása, frissítése
 - ▶ bejövő routing protokoll üzenetek alapján
- ▶ routing információk
 - ▶ feldolgozása
 - ▶ terjesztése

Routing protokollok

- ▶ Hálózat: abszrakt gráf
 - ▶ csomópontok: routerek
 - ▶ élek: linkek
 - ▶ élköltség: valamelyen metrika (pl. késleltetés, sávszélesség kifejezése)
- ▶ cél:
 - ▶ (valamelyen értelemben) optimális, legkisebb költségű útvonal meghatározása két csomópont között
 - ▶ pl. legrövidebb út
- ▶ Ismerős algoritmusok:
 - ▶ Dijkstra algoritmus
 - ▶ Bellman-Ford algoritmus

Csoportosításuk

- ▶ **Globális vs. Elosztott**
 - ▶ globális: minden router ismeri a teljes topológiát
 - ▶ elosztott: minden router csak a szomszédjait és a tőlük kapott üzeneteket ismeri
- ▶ **Intra-domain vs. Inter-domain**
 - ▶ intra: Interior Gateway Protocol (IGP)
 - ▶ közös adminisztratív domain
 - ▶ nem jól skálázódik
 - ▶ inter: Exterior Gateway Protocol (EGP)
 - ▶ külön adminisztratív domainek, AS-ek (Autonomous System) között
 - ▶ jól skálázódik (internet)
- ▶ **Link state vs. Distance Vector (ld. később)**

Csoportosításuk

- ▶ Interior Gateway Protocol (IGP) példák
 - ▶ OSPF (OpenShortest Path First)
 - ▶ IS-IS (Intermediate System to Intermediate System)
 - ▶ RIP (Routing Information Protocol)
 - ▶ EIGRP (Enhanced Interior Gateway Routing Protocol)
- ▶ Exterior Gateway Protocol (EGP)
 - ▶ BGP (Border Gateway Protocol)
 - ▶ Id. MSc (Internet architektúra és szolgáltatások főspecializáció)

Link State alapú routing

- ▶ Működési elv
 - ▶ globális nézeten dolgozik
 - ▶ LSP: Link State Packet (id, costs, seq.no, ttl)
 - ▶ egy router
 - ▶ mindenkinél küld LSP-t (broadcast)
 - ▶ a közvetlenül kapcsolódó linkjeiről
 - ▶ periodikusan újra generálja (seq.no++)
 - ▶ legfrissebb beérkezett LSP-ket tárolja
 - ▶ mindenki ugyanazt a topológiát látja
 - ▶ azon számolja az útvonalakat
 - ▶ útvonalszámítás: Dijkstra algoritmus

Például: OSPF

- ▶ Open Shortest Path First (v2)
- ▶ nyílt, IETF szabvány
 - ▶ v2: RFC 2328
 - ▶ IP felett
- ▶ együttműködés különböző gyártók termékei között!
- ▶ korlátozott erőforrás igény
- ▶ viszonylag gyors, automatikus konvergencia topológia változásokra
- ▶ támogatja
 - ▶ különböző útvonal költségek számítását
 - ▶ hierarchikus, többszintű topológiát
 - ▶ alkalmazás típusára alapozott forgalomirányítást
 - ▶ autentikációt minden üzenetre

Hálózatemulációs környezet

Netkit, Quagga

Netkit

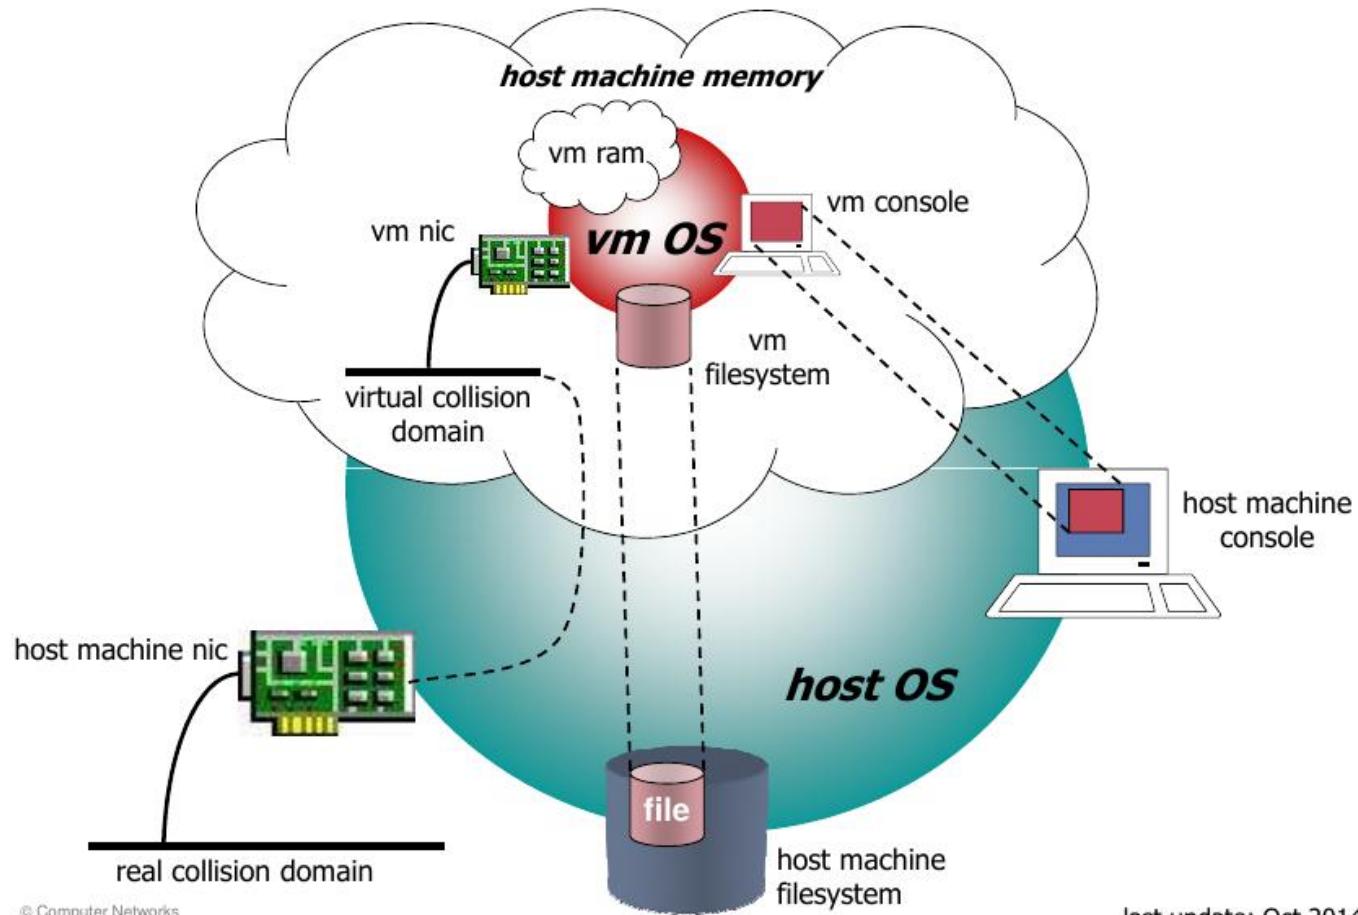

The poor man's system for experimenting
computer networking

Version	2.3
Author(s)	G. Di Battista, M. Patrignani, M. Pizzonia, M. Rimondini
E-mail	contact@netkit.org
Web	http://www.netkit.org/
Description	an introduction to the architecture, setup, and usage of Netkit

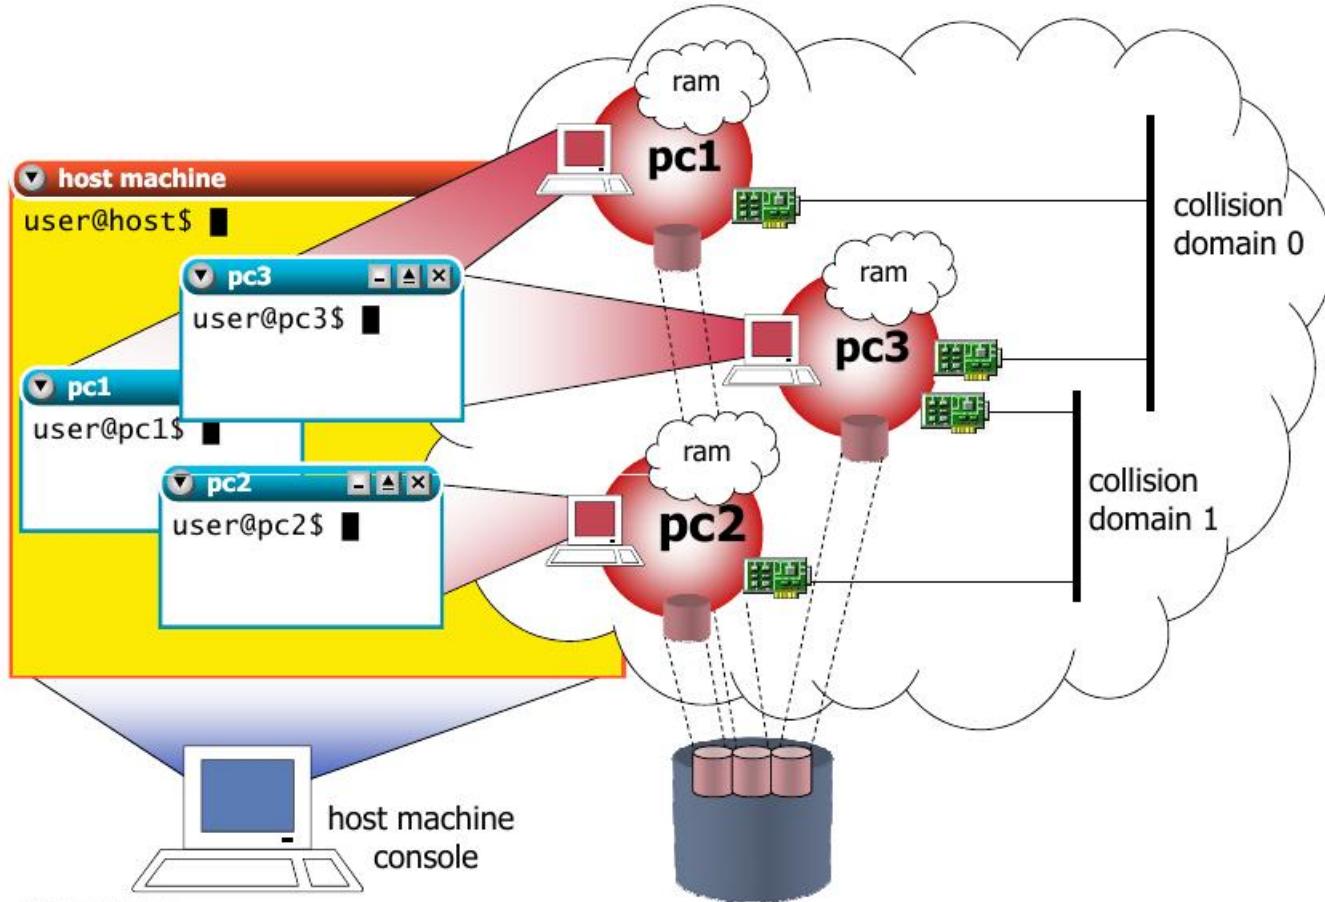

netkit: a system for emulating computer networks

- based on uml (user-mode linux)
 - <http://user-mode-linux.sourceforge.net/>
- each emulated network device is a virtual linux box
 - a virtual linux box is one that is based on the uml kernel
- note: the linux os is shipped with software supporting most of the network protocols
 - hence, any linux machine can be configured to act as a bridge/switch or as a router

Netkit

Netkit

netkit vcommands

- allow to startup virtual machines with arbitrary configurations (memory, network interfaces, etc.)
 - `vstart`: starts a new virtual machine
 - `vlist`: lists currently running virtual machines
 - `vconfig`: attaches network interfaces to running vms
 - `vhalt`: gracefully halts a virtual machine
 - `vcrash`: causes a virtual machine to crash
 - `vclean`: “panic command” to clean up all netkit processes (including vms) and configuration settings on the host machine

netkit lcommands

- ease setting up complex labs consisting of several virtual machines
 - `lstart`: starts a netkit lab
 - `lhalt`: gracefully halts all vms of a lab
 - `lcrash`: causes all the vms of a lab to crash
 - `lclean`: removes temporary files from a lab directory
 - `linfo`: provides information about a lab without starting it
 - `ltest`: allows to run tests to check that the lab is working properly

Quagga/Zebra

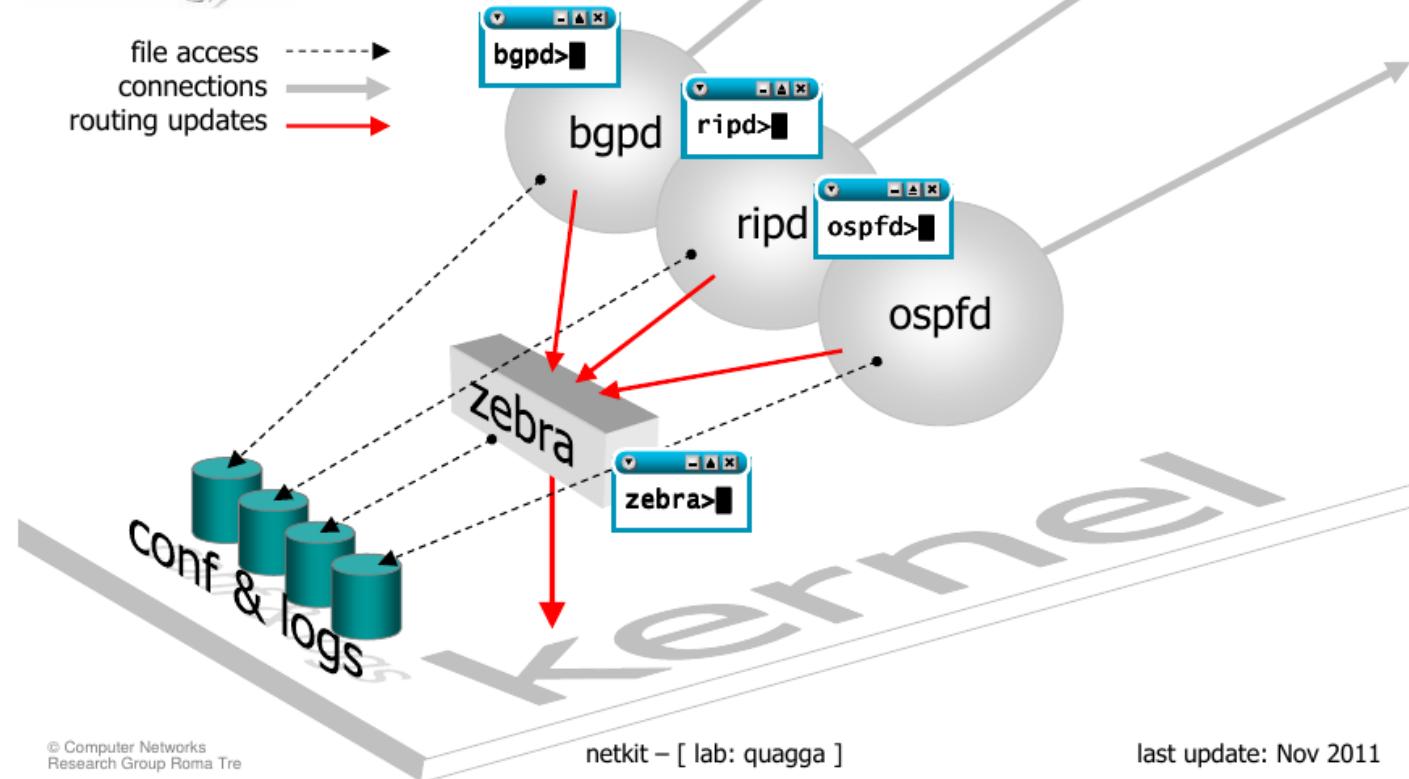

- ▶ Routing Szoftver csomag
 - ▶ GPL
 - ▶ FreeBSD, Linux, Solaris, NetBSD
 - ▶ GNU Zebra volt előbb
 - ▶ Quagga egy fork volt
 - ▶ “The Quagga tree aims to build a more involved community around Quagga than the current centralised model of GNU Zebra.”
 - ▶ az élővilágban a quagga halt ki
 - ▶ a routing világban a zebra

Quagga/Zebra

- ▶ Routing Szoftver csomag
 - ▶ zebra (core daemon)
 - ▶ kernel interface, static routes
 - ▶ zserv szerver (API) -> quagga kliensek felé
 - ▶ quagga démonok
 - ▶ routing protokollok
 - ripd, ripngd, ospfd, ospf6d, bgpd, isisd
 - ▶ mindegyikkel dedikált CLI-n (vty) keresztül kommunikálhatunk
 - hasonló interfész, mint egy HW routernél
 - ▶ speciális quagga tool: vtysh
 - közös front-end minden démonhoz

zebra: a routing daemon

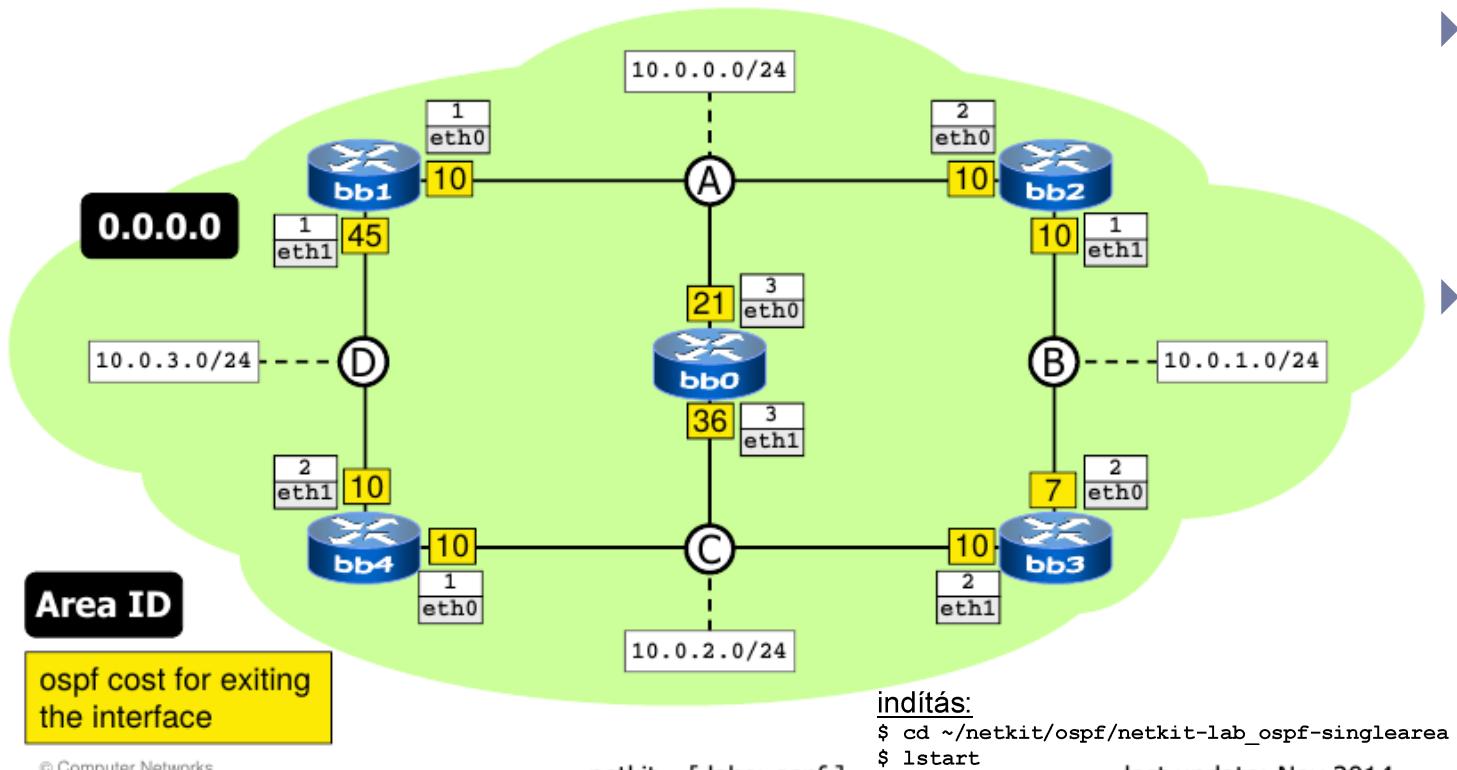

Kapcsolódás a vizsgálati környezethez

- ▶ VM-ek NIIIF cloud-ban
- ▶ egy publikus IP cím
- ▶ azon keresztül port forwarding
 - ▶ ssh -i ~/.ssh/lab_id_rsa.txt -N -L 5901:192.168.1.106:5901 ubuntu@193.224.20.65
 - ▶ lab_id_rsa.txt kurzus honlapról letölthető
- ▶ csatlakozás vncviewer programmal
 - ▶ localhost:5901
 - ▶ password

OSPF lab#1

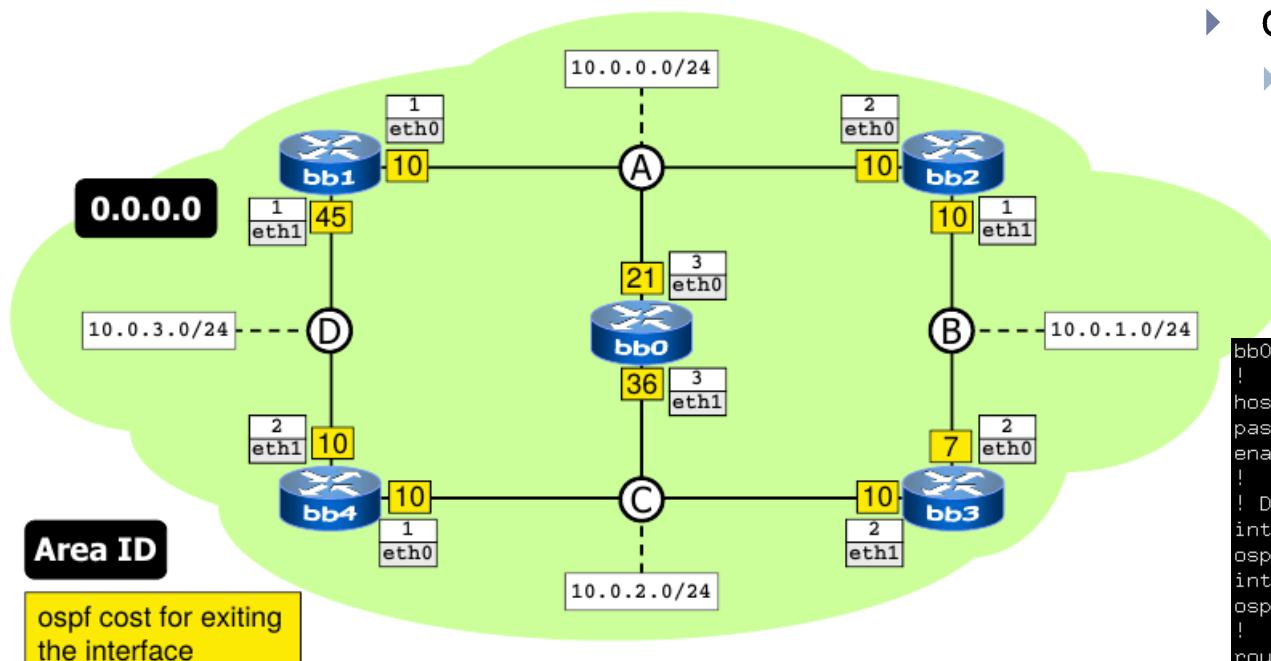

netkit-lab_ospf-singlearea

OSPF lab#1 topológia

- ▶ single (backbone) area
 - ▶ 0.0.0.0
- ▶ minden interfészhez
 - ▶ ospf cost
 - ▶ default: 10
 - ▶ néha trükkösen van beállítva!

OSPF lab#1 topológia

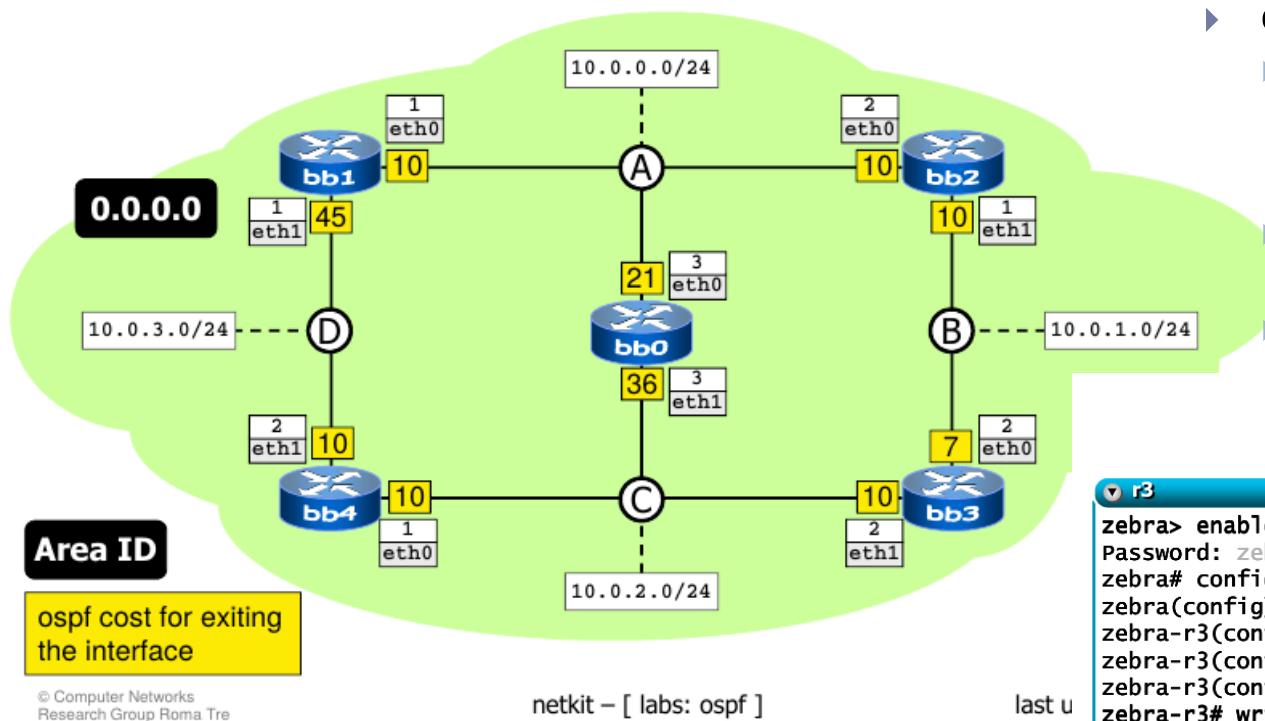

netkit – [labs: ospf]

last update: Nov 20

- ▶ quagga teszt, pl. bb0 routeren
 - ▶ cd /etc/zebra; ls -l
 - ▶ daemon conf fájlok
 - ▶ cat daemons
 - ▶ cat zebra.conf (passwd!)
 - ▶ cat ospfd.conf

```
bb0:/etc/zebra# cat ospfd.conf
!
hostname ospfd
password zebra
enable password zebra
!
! Default cost for exiting an interface is 10
interface eth0
ospf cost 21
interface eth1
ospf cost 36
!
router ospf
! Speak OSPF on all interfaces falling in 10.0.0.0/16
network 10.0.0.0/16 area 0.0.0.0
redistribute connected
!
log file /var/log/zebra/ospfd.log
```

OSPF lab#1 topológia

- ▶ quagga teszt, pl. bb0 routeren
 - ▶ telnet localhost zebra
 - ▶ szokásos lehetőségek
 - enable, configure terminal, ?, <tab>, show, list
 - ▶ telnet localhost ospfd
 - ▶ show ip ospf
 - ▶ vtysh (minden démonhoz)

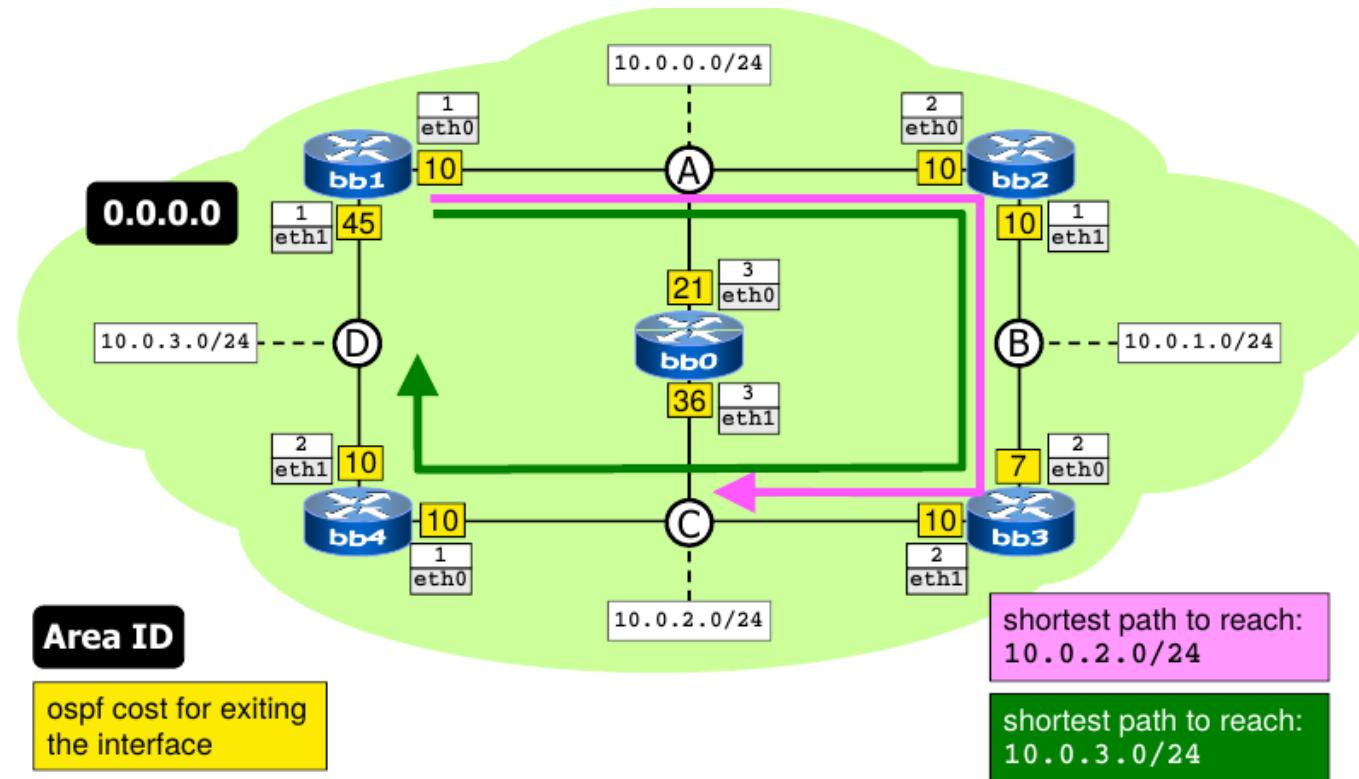

unprivileged user mode
privileged user mode
configurator mode

r3

```
zebra> enable
Password: zebra
zebra# configure terminal
zebra(config)# hostname zebra-r3
zebra-r3(config)# password foo
zebra-r3(config)# enable password foo
zebra-r3(config)# quit
zebra-r3# write file
Configuration saved to /etc/zebra/zebra.conf
zebra-r3# disable
zebra-r3> exit
Connection closed by foreign host.
r3:~#
```

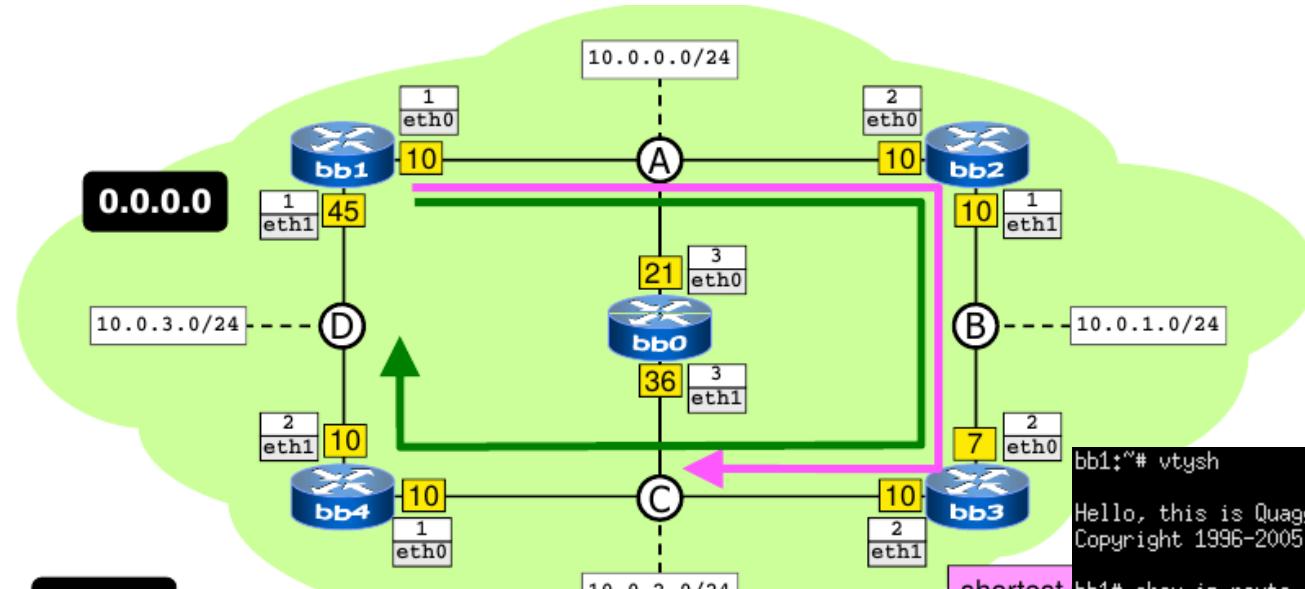

enter privileged user mode
start editing configuration
edit configuration
stop editing configuration
write changes to file
exit privileged user mode
exit

10.0.3.2	10.0.3.2	468	0x80000005	0x63b7

Designated Router (DR) és BDR

(router interfaces designated for each network)

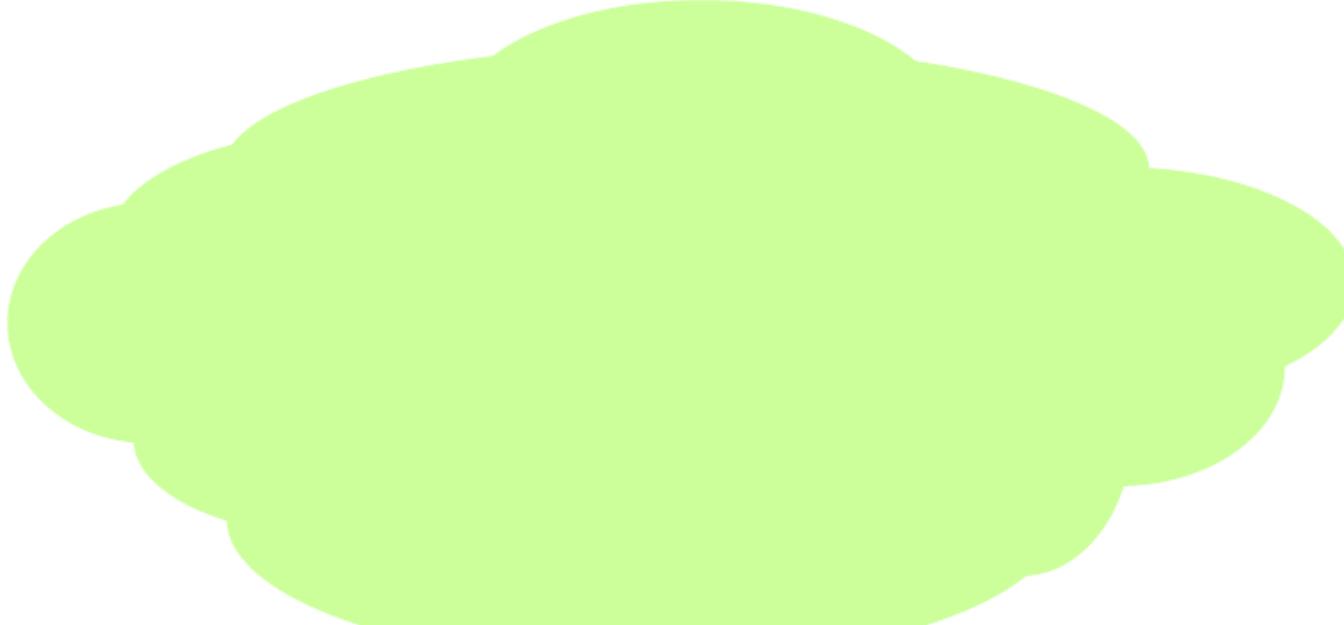

show ip ospf interfaces

- ▶ Broadcast hálózatoknál
 - ▶ pl. Ethernet
 - ▶ DR és Backup DR: kitüntetett routerek
 - ▶ választás alapján
 - ▶ router id alapján
 - ▶ (ami interfész id)
 - ▶ többi OSPF router csak velük van full szomszédságban
 - ▶ különben mindenki mindenkel kommunikálna
 - ▶ útvonalfrissítés csak DR-től
 - ▶ sok erőforrás spórolható

ospf's view of the network

- by exchanging link state update packets, every router learns about the complete network topology, that is:
 - routers
 - subnets
 - adjacencies between routers and networks

ospf's view of the network

```
bb0# show ip ospf database
```

ospf's view of the network

OSPF Router with ID (10.0.2.3)						
Router Link States (Area 0.0.0.0)
